## CARNEGIE BEAM SECTIONS

### STATUS OF ROLLS

FOR THE SECTIONS SHOWN IN FIRST EDITION OF  
PAMPHLET ENTITLED "CARNEGIE BEAM  
SECTIONS, PROFILES AND PROPERTIES,"

DATED JANUARY 1, 1927.

FIRST GROUP—10 SECTIONS.

ROLLS ARE NOW READY FOR THE FOLLOWING 10 SECTIONS,

	SECTION No.	DEPTH	FLANGE WIDTH	
1	CB-103	10"	9"	Constant Depth.
2	CB-104	10"	10"	Constant Depth.
3	CB-105	10"	12"	Constant Depth.
4	CB-126	12"	14"	Constant Depth.
5	CB-127	12"	14"	Constant Depth.
6	CB-122	12"	6 $\frac{1}{2}$ "	
7	CB-142	14"	6 $\frac{3}{4}$ "	
8	CB-146	14"	15"	
9	CB-181	18"	7 $\frac{1}{2}$ "	
10	CB-242	24"	9 $\frac{3}{4}$ "	

## CARNEGIE BEAM SECTIONS

### SECOND GROUP—13 SECTIONS.

A group of 13 sections has been selected for which roll equipment will be prepared next, as follows:

	SECTION No.	DEPTH	FLANGE WIDTH	
11	CB-145	14"	12"	
12	CB-241	24"	8 $\frac{1}{2}$ "	
13	CB-121	12"	6"	
14	CB-141	14"	6"	
15	CB-161	16"	6"	
16	CB-162	16"	7"	
17	CB-124	12"	10"	Constant Depth.
18	CB-125	12"	12"	Constant Depth.
19	CB-211	21"	8"	
20	CB-271	27"	9 $\frac{3}{4}$ "	
21	CB-301	30"	10 $\frac{1}{2}$ "	
22	CB-101	10"	6"	
23	CB-102	10"	8"	Constant Depth.

It is proposed to prepare rolls for the above mentioned group of 13 sections substantially in the order named. We hope to be prepared to roll the first of these sections about the middle of March, completing the group about the middle of May.

### THIRD GROUP—REMAINING SECTIONS.

With the exception of 8" sections CB-82, CB-83, B-39 and the 9" sections, CB-92, CB-93 and B-40, it is hoped that roll equipment for all of the remaining sections will be ready by the middle of June.

While the designs for the 8" and 9" sections are included in the pamphlet, and are a part of the range of sections, it is proposed to defer preparing for these sections until a later date. In the meantime requirements for an 8" section can be supplied by the use of our present 8" H-beam known as section H-4.

## CARNEGIE BEAM SECTIONS

**S**INCE the adoption of the present American Standard Beam Sections, in 1896, developments of such magnitude have taken place in the structural steel industry, both at home and abroad, as to demand an improved series of rolled sections suitable for both beam and column purposes.

The series now placed on the market under the name **CARNEGIE BEAM SECTIONS**, provides for this demand by means of a series of shapes combining sound engineering principles with practical improvements. All its sections are produced on a structural mill of the most advanced type.

The series provides a range of rolled steel beam and column sections progressing by regular steps, with contours that will permit sections to be used interchangeably for whichever purpose they are adapted, and in sizes and weights sufficiently varied to meet all ordinary requirements. Their efficiency is high and their component parts are proportioned to permit of ready fabrication.

### ADVANTAGES

The advantages characterizing the new series of Carnegie Beam Sections will be explained under the following captions:—

CONTOUR DESIGN

WEB AND FLANGE RATIO

RANGE OF SIZES

PROGRESSIVE BEAM DESIGN

IMPROVED COLUMN DESIGN

17 91-B2067 Cor'm 10

## CARNEGIE STEEL COMPANY

### CONTOUR DESIGN

A new form of contour has been adopted whose principal characteristic is the elimination of internal flange slope, the flanges being of uniform thickness throughout their width. This feature increases the strength of the section, permits simpler connections and facilitates fabrication.

Carnegie Beam Sections permit the use of maximum unit stresses in shear and compression for resistance to web buckling and flange crippling, respectively, in conformity with usual building specifications. All fillets, which are parabolic in form, combine maximum spread with minimum area.

### WEB AND FLANGE RATIO

In the production of most of the Carnegie Beam Sections a method is used whereby an adequate variety of weights in each group, having substantially equal efficiency per pound, is attained by spreading both horizontal and vertical rolls a proportionate amount. This practice causes the depth of sections to vary somewhat from the nominal, but this variation is kept within limits that will not affect the standardization of details.

A second characteristic, found in the heavier groups of column sections, is an increase in width as compared with depth, combining maximum economy in design of framing and in floor space.

### RANGE OF SIZES

Carnegie Beam Sections provide a range of beam and column shapes, from 8 to 30 inches deep and from 5 to 16 inches wide, in weights up to 305 pounds per linear foot, with section moduli about the major axis up to 738 in.<sup>3</sup>, and with radii of gyration about the minor axis up to 4.14 in.

In general, no sharp line has been drawn between beams, girder beams and columns. The consequent economy in number of sections will insure better deliveries, reduce the number of sizes carried in stock, and allow a greater standardization in shop methods and tools.

Profiles, dimensions and weights are given on pages 8 to 30. Other data pertaining to dimensions and properties are tabulated on pages 32 to 41.

The range of depths in which occurs the greatest normal demand is covered by the adoption of sections 14 and 16 inches deep, affording the designer a better and more economical selection of sections to be used as beams.

## CARNEGIE BEAM SECTIONS

### PROGRESSIVE BEAM DESIGN

The introduction of the 14 and 16 inch Carnegie Beam Sections gives a progressive series in which each depth is approximately 15 per cent greater than the preceding depth, as shown graphically on range charts on pages 32 and 33. In addition, successive weights in each group are so arranged that their strengths progress by steps having close and approximately regular ratios of increase.

Intermediate groups of heavier sections, of the same depth but with wider flanges and greater strength, are provided for use as beams in structures where it is important to limit the depth of section. These sections are also suitable for columns.

The selectivity of the series for use as beams is indicated graphically in the tables and charts on pages 34 to 37.

Minimum weights of 10-, 12-, 14- and 16-inch sections are offered with a uniform width of 6 inches, which permits a corresponding uniformity in fireproofing and finish.

Very complete groups of sections 24, 27 and 30 inches deep, are provided with flanges 14 inches wide. These will be found convenient for use in structures that cannot be braced laterally and may also be used to advantage where limited clearance is an important factor in design.

Efficient sections, notably 12 inches and deeper, are provided with webs  $\frac{3}{8}$  inch in thickness, in order to comply with specifications requiring a minimum thickness of metal.

### IMPROVED COLUMN DESIGN

Carnegie Beam Sections include two groups: a **Variable-Depth Type** and a **Constant-Depth Type**. The sections of the latter group are intended primarily for columns, though sections of either type may also be used as beams or girders. In the **Variable-Depth Type** both depth and width increase proportionately as weights increase from the minimum. In the **Constant-Depth Type** the depth does not change, the increase in weights being obtained by thickening the web and widening the flanges. With the heavier groups of both types, high properties about the minor axis are secured by the proportions adopted.

## CARNEGIE STEEL COMPANY

The **Variable-Depth Type** contains notably sections of the following depth, flange width and weights:—

CB 83	8" x 8"	31 to 90 lbs.
CB 145	14" x 12"	85 to 105 lbs.
CB 146	14" x 15"	115 to 305 lbs.

These sections will be used principally as columns.

In addition, sections 8, 9, 10, 12 and 14 inches deep, are provided having intermediate flange widths which may be used either as beams in shallow floors or as light columns.

The **Constant-Depth Type** is offered in two depths only, 10 and 12 inches, with the following flange widths and weights:—

CB 102	10" x 8"	31 to 42 lbs.	CB 124	12" x 10"	75 to 100 lbs.
CB 103	10" x 9"	49 to 63 lbs.	CB 125	12" x 12"	110 to 140 lbs.
CB 104	10" x 10"	70 to 92 lbs.	CB 126	12" x 14"	150 to 180 lbs.
CB 105	10" x 12"	100 to 140 lbs.	CB 127	12" x 14"	190 to 230 lbs.

The 10-inch series will take care of an ordinary 12-story building, while the 12-inch series, in conjunction with the 10-inch series, will take care of an ordinary 18-story building. If desired, the scope of any group can be extended by reinforcement with flange plates.

The **Constant-Depth Type** presents an innovation in rolled steel column sections in that the over-all depth for all sizes of a nominal depth does not vary. The advantages of this feature are reflected in the symmetry of beam and spandrel framework connecting to the columns at a number of successive floors in a steel building, thus effecting a substantial saving in the drafting room, fabricating shop and in the field. The avoidance of fillers under splices on the columns themselves is also advantageous. To the architect and the general contractor constant depth is valuable in that it permits a greater uniformity in fireproofing and finish.

### MISCELLANEOUS DATA

All weights per linear foot of Carnegie Beam Sections are expressed in whole pounds. Fillets are included in weights, areas and other properties.

The dimensions to which the rolls for Carnegie Beam Sections are turned extend to three decimal places of an inch, as shown on diagrams on pages 8 to 29, but it will be more convenient for the designer to use the fractions to which they have been rounded in the tables of dimensions of sections on pages 33 to 41.

Carnegie Beam Sections will be furnished to the specifications of the Association of American Steel Manufacturers, American Society of Testing Materials or to such other acceptable standard specifications as may be required.

## CARNEGIE BEAM SECTIONS

### RANGE OF SECTIONS SELECTED FOR USE AS BEAMS

# CARNEGIE BEAM SECTIONS

## EXPLANATORY NOTES

Ranges of Sections shown in diagram have been charted logarithmically: the Vertical Scales indicating the Section Moduli and the Horizontal Scales the Depths in Inches.

Locate horizontal line corresponding to the required Section Modulus and from this line select a suitable section of the required depth.

Each weight of section is shown by a circle, a solid circle indicating a section with metal not less than  $\frac{3}{8}$  inch thick.

Groups of Sections having the same internal depth and width are connected with continuous lines; those having only the same internal depth are connected with broken lines.

SERIES OF DEPTHS HAVING CONSTANT RATIO
